## QUARTET Optical Heads

## STANDARD SPOT SIZE (2" collection)

The standard optical fiber head uses a standard 2" collecting lens. By using different focusing element [A], the optical head can be set-up for a variety of stand-off distances. This front lens can be easily changed or replaced. Adjusting element [B] can also be used to focus the optical head.

## OPTICAL HEAD

[A] - Focusing lens ( $\mathrm{F}=100,200$ or 500 mm )
[B] - Rotation element for focus adjustment

The Stand-off distance corresponds to the distance between the sample and the front of the Optical Head (the front edge of the lens sleeve). The stand-off position is a function of the focal length selected [A] and the focus adjustment [B]. The Quartet is optimized for a highly speckled signal beam. Example of stand-off distances and the corresponding spot size of the beam on the sample surface is summarized in the table below: For exact stand-off distance values, check the provided Datasheet.

| Focusing lens | Stand-off distance* | Nominal spot size |
| :---: | :---: | :---: |
| $\boldsymbol{F}=\mathbf{1 0 0} \mathbf{m m}$ | $80 \mathrm{~mm}-105 \mathrm{~mm}$ | $\geq 50 \mu \mathrm{~m}$ |
| $\boldsymbol{F}=\mathbf{2 0 0} \mathbf{m m}$ | $175 \mathrm{~mm}-311 \mathrm{~mm}$ | $\geq 100 \mu \mathrm{~m}$ |
| $\boldsymbol{F}=\mathbf{5 0 0} \mathbf{m m}$ | $460 \mathrm{~mm}->4 \mathrm{~m}$ | $\geq 250 \mu \mathrm{~m}$ |

[^0]Note: The focus position corresponds to the greatest speckle size scattered back from the workpiece.

## SMALL SPOT SIZE (1" collection)

The high-resolution optical fiber head uses a 1" collecting lens. As with the standard head, fitting different focusing elements [A] will vary the stand-off distance. This front lens can be easily changed or replaced. Adjusting element $[\mathrm{B}]$ can also be used to focus the optical head.
